The Translating Research into Practice (TRiP) team has consistently worked to disseminate findings from their research on Mpowerment, a social norms approach to HIV prevention. Based on their dissemination efforts and feedback from community-based organizations (CBOs), they sought funding to adapt Mpowerment for Black young men and transgender young adults.

Based on their dissemination efforts and feedback from CBOs, they continued to adapt Mpowerment for broader audiences. They developed a dissemination plan and budget that included 1) printing and distributing materials such as fact sheets and posters, 2) providing training to CBOs on how to disseminate the intervention, and 3) creating opportunities for study participants to share their experiences.

TRiP works with the Centers for Disease Control and Prevention (CDC) to make sure Mpowerment is not just disseminated, but also adapted to meet the needs of different populations. In addition to publishing in peer-reviewed journals and presenting at scientific conferences, they are dedicated to making their research accessible to the Spanish-speaking population they work with. Examples of their innovative work include:

- Susan Kegeles, PhD
- Héctor Carrillo, DrPH
- Lisa Moore
- Stephan Oxendine
- Patricia Perkins
- Brenda Storey
- Dan Wohlfeiler
- Ellen Goldstein
- Pamela DeCarlo

From the beginning, CBOs called Susan and asked about Mpowerment, wanting to do the intervention in their cities. They were in the first group of researchers to replicate and create dissemination plans. They have been involved in sharing the recommendations with policymakers.

To maintain the quality of dissemination, they developed a budget that supports dissemination efforts. They also asked study participants how they would like to be informed of findings.
